

Topic: “PowerChiplet” Technology, Ultra-high-power Density Platform for Future Power Electronics

Chair: Naoto Fujiishima, Fuii Electric, JP

Organizer: Ichiro Omura, Kyushu Institute of
Technology, JP

Conference Room 1

Topic :
**“PowerChiplet” Technology,
Ultra-high-power Density Platform for
Future Power Electronics**

Chair: Naoto Fujiishima, Fuii Electric,JP

Organizer : Ichiro Omura, Kyushu Institute of Technology, JP

Motivation

Achieving higher power density has been a key issue in power electronics, driven by the increasing demand for miniaturization in AI servers, powertrains, and on-board chargers (OBCs) for electric vehicles (EVs). However, **a next-generation platform for future ultra-high-power-density power electronics has not yet been clearly defined.**

In **high-performance computing (HPC)**, “**Chiplet**” technology has emerged as a future platform to address the **slowdown of Moore’s Law, reduce costs**, and enable advanced heterogeneous integration. This concept is expected to be adopted in power electronics to achieve ultra-high-power density and a high level of system integration.

In this session, the new concept of the “**PowerChiplet**” will be discussed for the first time as a **future platform for power electronics, with a focus on chip-embedded PCB technology**. The speakers are specialists from China, Japan, and Europe. If you are interested in the future impact of “Power Chiplet” concept in power electronics as the ultra-high power density platforms, and system integration with chip embedded PCB technology, we invite you to join this session.

Presentations

- **Power Chiplet Technology for Next Generation Power Electronics Systems**
Speaker: Ichiro Omura, Kyushu Institute of Technology, JP
- **Advanced Packages With Power-On-Substrate Solutions**
Speaker: Frye Fung, Zhuhai ACCESS Semiconductor Co., Ltd.. CN
- **Chip Embedded Panel level Power Package for AI and Vehicles**
Speaker: Yoshiaki Aizawa, Aoi Electronics, JP
- **Novel Integration Concepts for Power Electronics - Embedding of SiC MOSFET for High-performance Power Modules**
Speaker: Lars Boettcher, Fraunhofer IZM Berlin, DE
- **Discussion** 

Power-Chiplet Technology for Next Generation Power Electronics Systems

Ichiro Omura
Kyushu Institute of Technology
Japan
大村 一郎 九州工业大学

Agenda

- "Chiplet" for High Performance Computing
- Road Maps of Power Semiconductors
- Why "PowerChiplet"?
 - Chip level
 - Gate drive / Circuit level
 - System level
- Summary

Chiplet, how it looks like?

Multiple Small Chips (Tiles) with Different Nodes/Functions are Heterogeneously Integrated → Cost Reduction and System Flexibility

多个具有不同节点/功能的小芯片（瓷砖）异构集成 → 成本降低和系统灵活性

AI = Computation and Energy Infrastructure

Computation used to train intelligence systems
(by our world in data)

Minimizing of Transistor Size is the Solution

缩小晶体管尺寸是解决方案

ASML Lithography System Price

Increasing Chip Costs and Decreasing Yield

芯片成本上升，良率下降

“Chiplet”, Smaller Chip Concept

Data from: L. T. Su et al., "Multi-chip technologies to unleash computing performance gains over the next decade, IEDM 2017, doi: 10.1109/IEDM.2017.8268306.

Chiplet Technology Reduces the Cost and Shorten the Development Cycle

“芯粒”技术可降低成本并缩短开发周期

Chiplet Technology Overview

1. A chiplet is a technology that integrates **small chips** into a package to build **large-scale systems**.
2. It enables heterogeneous integration of circuits and functions across **different process nodes**, while offering high **design flexibility** in system architecture.
3. Applying chiplet technology may allow the **growth of computation per kWh** for future AI technology with **lower cost**.

Agenda

- "Chiplet" for High Performance Computing
- **Road Maps of Power Semiconductors**
- Why "PowerChiplet"?
 - Chip level
 - Gate drive / Circuit level
 - System level
- Summary

Power Electronics Power Density Trend toward 2035

H. Ohashi, I. Omura, Role of Simulation Technology for the Progress in Power Devices and Their Applications, IEEE TRANSACTIONS ON ELECTRON DEVICES, VOL.60, NO.2, 2013

Power Density Increase 10x for Every 15 Years → 1kW/cc in 2035

预计功率密度每15年增长10倍，到2035年将达到1 kW/cm³。

WBG Power Semiconductors

Vertical Device

T. P. Chow, I. Omura, M. Higashiwaki, H. Kwarada and V. Pala, "Smart Power Devices and ICs Using GaAs and Wide and Extreme Bandgap Semiconductors," in IEEE Transactions on Electron Devices, vol. 64, no. 3, pp. 856-873, March 2017

Higher Switching Speed and Lower Conduction Loss with Smaller Chip Size

但开关速度更快，导通损耗更低，芯片尺寸更小。

Power Electronics Price Trends

Item	Learning Rate	Source
<u>PV module</u>	20%	Bloomberg New Energy Finance
Onshore wind	19%

Very Low L_s (Self or Mutual) Wiring is Required for Advanced Devices

高级设备需要极低的 L_s (自感或互感) 接线

Agenda

- "Chiplet" for High Performance Computing
- Road Maps of Power Semiconductors
- Why "PowerChiplet"?
 - Chip level
 - Gate drive / Circuit level
 - **System level**
- Summary

Interconnection between Chips and Power Circuit

Clearance and Creepage Distance

Cu Patten Spacing
Inside Module
~1mm

~1mm

0.5~1.0cm

Creepage

Clearance

Wiring and Connection INSIDE the PCB to Reduce the Size

Needs of System Integration

Complexity of Device Operation

Lateral Bidirectional Device Case

Peripheral Circuits of Chip Need to be Integrated to be the System

芯片外围电路需集成成系统

Chip Embedded PCB Packaging → System

Level 1: New Packaging of Existing Products

Utilizing existing semiconductor products with updated packaging technologies.

Packaging

Level 2: PowerChiplets Using Existing Chips

Combining existing power chips and gate drivers etc. as “Tiles” to enhance modularity and integration.

Sub-system

Level 3: PowerChiplets with Dedicated Chips

Developing power chips and gate driver etc. specifically designed for PowerChiplet.

Sub-system Plus

Level 4: System-Level Power Chiplets

Constructing entire power electronics systems using PowerChiplet technology.

System

Agenda

- "Chiplet" for High Performance Computing
- Road Maps of Power Semiconductors
- Why "PowerChiplet"?
 - Chip level advantage
 - Gate drive level advantage
 - System level advantage
- **Summary**

Why PowerChiplet

➤ Chip Level

- Chip Cost Reduction
- Thermal Resistance Reduction

➤ Gate Drive / Circuit Level

- Stable Switching (No oscillation)
- High Speed Switching (Reduction of L_s)
- Solve the Complexity

➤ System Level

- Size Reduction of Connection to Power Circuit (Creepage, Clearance)
- PE System Level Cost Down

PowerChiplet

- Test
- Co-Design
- Standard (3DBlox?)
- Reliability
- Cost
- Recyclability
- Passive Components
- Isolation (Electrical, Thermal, Signal)
- Others

Presentations

- **Power Chiplet Technology for Next Generation Power Electronics Systems**
