

Chip Embedded Panel level Power Package for AI and Vehicles

Yoshiaki Aizawa, Katsuhiro Takao
AOI ELECTRONICS CO.,LTD.

FOLP® Technology Direction (Trend)

RDL-first (fine pitch/multi-layer)

High Frequency

Multi-Layer, 3 D FOLP®

High Via connection reliability
Deep plugged Via
Low RF signal loss
(Low Df material)

High-end Logic

Fine pitch FOLP® Chiplet

Fine pillar pitch
Fine Line/Space
High yield (Simple structure)

Chip-first (high heat dissipation/low resistance)

Power Module

Thinner , Heat dissipation FOLP®

Low electrical resistance wiring
Low inductance wiring
High heat dissipation
(High thermal conductive material)
High operation temperature
(High Tg material)

- ✓ Background
 - Why are Chip Embedded Packages required?
 - Chip Embedded Package Technologies
- ✓ Chip Embedded Power Package for AI/Data center applications
 - Coreless Chip Embedded Technology (AOI Panel Level Package)
Ex. Thin Multi chip voltage regulator (and with built-in inductor)
- ✓ Chip Embedded Power Package for Automotive applications- Power Sub Module
 - Packaging Technologies
 - AOI Panel Level Power Chip Embedded Technology
Ex. Chip embedding process with thick Cu RDL
Cu direct plating on the back side of power chips
- ✓ Summary

- ◆ Power semiconductor plays as a key role in the rapid development of automotive (EV) due to environmental issues
- ◆ AI/data center require high efficiency power supply system due to increasing power consumption
- ◆ As power supply output current increasing, wiring resistance is a big issue about power distribution loss.
- ◆ Reducing parasitic inductance, wiring resistance, and shortening the current loop are necessary in high density environment.
- ◆ Chip-embedded packages (PoP/CoP/3D-SiP) can shrink size and increase current density.
- ◆ Inverters and DC/DC converters are the need for efficient power management system.

Chip Embedded Power Package for AI/Data center applications

Source : NTT Corporation

■ Applications : Power Supply System

Source : NTT Corporation

Source : University of Twente, the Netherlands

- ✓ AI/Data Center requires high efficiency power supply system at both high voltage and low voltage levels due to increasing power consumption.
- ✓ As power supply output current and switching frequency increase, wiring resistance and inductance are a major concern for power distribution losses and power integrity.
- ✓ Regarding the low voltage stage, placing the voltage regulator (VR) and passives close to the active die (CPU/GPU/HBM, etc.) is very important for power integrity (PI).
- ✓ Substrate embedded VR and passives are a good solution for PI improvement.
- ✓ The embedding of the power module and inductor is a big challenge due to the high profiles.

Thermal Resistance Simulation Comparison between
Panel Level and PCB Based Package

pcim
ASIA SHANGHAI

■ Simulation result

	Our Concept package (Panel Level Package)	PCB prepreg package (assumption)
Structure	 t50µm	 t12µm t100µm t12µm Via : φ0.1mm, pitch 0.6mm
Thermal simulation result	Inside the Package image  ΔT [°C] θ_{jc} : 0.5 [°C/W] (Package only) Cross-section A - A' 	Inside the Package image  ΔT [°C] θ_{jc} : 3.7 [°C/W] (Package only) Cross-section A - A' 

The thermal resistance of our concept package is very low, and it has the advantage of quickly dissipating heat to the substrate side.

Coreless Chip Embedded Technology (AOI Panel Level Package)

AOI's new approach of *Ultra thinner, Higher heat dissipation* chip embedded technology in analog and power solutions.

Features of this concept

- Unique Coreless structure with all-Cu plating embedding method, using power customized fan-out processes
- Panel form of 300 mm square with cost benefit
- Smaller and Ultra thinner module package with coreless structure
- Excellent thermal property with large electrode pad and large via filling
- High reliability and short TAT with one stop solution (from panel substrates to package assembly in-house)

Source : IMAPS DPC 2023 AOI

Manufacturing Process Flow for a Prototype

■ Panel level package manufacturing flow

We can perform one-stop production in-house, from panel substrates to chip embedding process, panel RDL process and package assembly.

Basic Process Flow for a Prototype

■ Basic Process flow (1)

1. Electrode Pads Formation on Glass Carrier

2. Controller and Power Chips Bonding

3. Molding

4. Laser via drill

5. Cu plating for Via-filling and RDL1

6. Laminating for Insulation layer

Basic Process Flow for a Prototype

■ Process flow (2)

7. Laser via drill

8. Cu plating for Via-filling and RDL2

9. Solder resist formation

10. Glass Carrier Debonding / Terminal plating / Singulation

Our usual inspection or test

- Pattern inspection for each process
- Open/short test for checking internal connection
- Optional function test

Trial production and evaluations for a Prototype

- 300 mm square Panel-level photo

Warpage Before singulation (with Glass Carrier)

Panel warpage : 2mm Maximum

Package structure

■ Prototype package structure

Cross-section A-A'

Cross-section B-B'

- Ultra-thin & high heat dissipation module with DC-DC half-bridge structure.
- Motif of GaN HEMT for power and high-speed switching.

Package thickness & X-ray CT 3D image

■ Prototyped package Package thickness

New Coreless chip embedded module package

Top side

Bottom side

Package size : 7.0×7.5mm

X-ray CT 3D image (Internal structure)

Our proposed new Coreless chip embedded package thickness is actual 0.34mm. It is very thin compared to conventional power QFN. Very thin SoC-like analog and power module package such as heterogeneous chip bonding can also be realized.

Package Cross-section

■ Prototyped package

Cross-section SEM image

Direct Cu plating connection of power chips

Chip attached paste

× 1,000

Good Necking

× 50,000

Warpage (coplanarity) evaluation result of package level

■ Package warpage

Warpage Behavior in the Reflow Temperature Range using shadow moiré method (3D Plot)

At room temperature, warpage was maximized (less than 50µm) with smile shape.
At high reflow temperature, warpage became small, tended to be flat.

Thin Multi chip power module for Chiplet integration device application

■ Suitable power delivery by IVR (Integrated Voltage Regulator)

Thin GaN HEMT voltage regulator with built-in inductor

■ GaN HEMT voltage regulator with a built-in inductor formed by Cu rewiring plating (RDL)

Vertical structures (Cu plating (RDL) & Isolation layers)

u=1/1/1	u=1/3.5/1	u=1/3.5/3.5	u=3.5/3.5/3.5

Power Module Packaging Technologies

Several SiC inverter modules (packages) have been proposed, but further concept development is needed in terms of heat dissipation, high current, parasitic resistance, inductance and scalability.

Current module (package) trends

Source : IEEE/Comprehensive_Review_and_State_of_Development_of_Double-Sided_Cooled_Package_Technology_for_Automotive_Power_Modules

Case module (package) type

- High customizable package design
- Complicated wiring
- Thinning down is limited due to wire loops
- High parasitic inductances due to long wire loops
- Wire bonding junction failure in reliability

Discrete type

- Larger mounting space
- Need many packages (Cost)
- High parasitic inductance

Parasitic inductance of each module

Power Modules Towards Planar Power

Proposal for Core Power Module Package using chip-embedded technology with high scalability for inverter applications

Basic Concept structure

<Top view>

**Power chip
Parallel connection ;
2, 3, ... N parallel**

Features

- Core power module package uses a semi-additive fan-out panel-level process (FOLP[®] technology) customized for power applications.
- Cost-effective 300 mm square panel manufacture format.
- Uniquely epoxy coreless substrate and chip embedding technology.
- High current density by power chiplet like (chip parallel connection) technology
- Robust Cu-plated (Via and rewiring) interconnect technology.
- Enhanced High heat dissipation, High current density, low resistance and inductance.
- Integrated in-house production from panel substrate to package assembly.

New Release: Panel manufacturing capacity expansion

NEWS RELEASE
31 July 2025

Regarding the Construction of the Production Line For Advanced Semiconductor Panel Packages at Sharp Mie Plant

Plant No.2

Plant No.1

By acquiring the second plant in addition to the first plant we already have, we will strengthen our ability to respond to new businesses, including the Advanced Packaging Business, with the aim of quickly launching a production line. At the same time, we will further accelerate the installation of necessary dedicated equipment and strengthening of our human resources structure, aiming to start full-scale operations in fiscal year 2027.

Going forward, by organically linking and optimizing the functions of both factories, we will aim to expand production capacity, streamline processes, and strengthen our supply system, thereby building a flexible and efficient production system that will enable us to respond more quickly to changes in market needs.

Summary

- ✓ There is an increasing market requirement for lower resistance and lower inductance, especially in the AI/data center and EV markets.
- ✓ Chip Embedded Technology is attracting a lot of attention due to the above market situation.
- ✓ Embedded Technology at the panel level is one of the most promising and realistic candidate.
- ✓ Regarding the AI/Data center market, the key is not only embedding the semiconductor chips but also embedding the passive components for high Power Integrity requirement.
- ✓ Regarding the EV inverter market, the key technologies are interconnection between the chip and metal base, as well as thick Cu RDL wiring. This reduces both electrical and thermal resistance and inductance, thereby improving efficiency.
- ✓ Reliability is the key issue, particularly with regard to interconnection between the chip and the metal, and delamination between each layer (e.g. chip/resin, Cu RDL/resin).

Thank you for your interest
